### Problem 3: Torque, Rotation and Translation

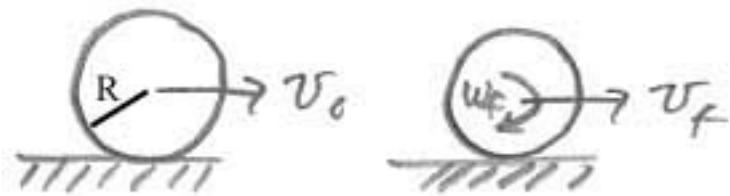

A Yo-Yo of mass  $m$  has an axle of radius  $b$  and a spool of radius  $R$ . Its moment of inertia can be taken to be  $I = (1/2)mR^2$  and the thickness of the string can be neglected. The Yo-Yo is released from rest.

- What is the tension in the cord as the Yo-Yo descends?
- Use conservation of energy to find the angular velocity of the Yo-Yo when it reaches the bottom of the string.
- What happens to the Yo-Yo at the bottom of the string?

### Problem 4: Rolling Cylinder

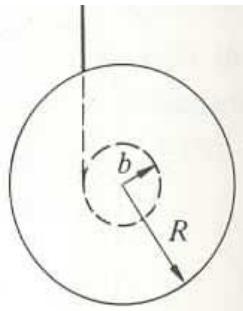

A solid cylinder of mass  $m$  and radius  $R$  is initially thrown along a wooden floor hallway with an initial speed  $v_0$  and zero initial angular velocity  $\omega_0 = 0$  as shown in the figure below.

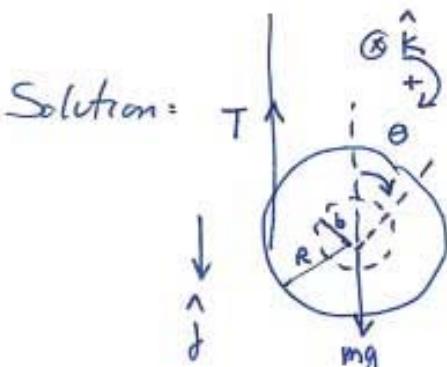

- What is the moment of inertia of the cylinder about the axis of rotation of the cylinder?
- What effects does friction have on the cylinder before it reaches its final speed? Is the friction static or kinetic? Which direction does it point?
- What is the angular speed,  $\omega_f$ , of the cylinder when it just starts to roll without slipping? Express your answer in terms of  $m$ ,  $R$ , and  $v_0$ .

### Problem 3: Torque, Rotation and Translation

A Yo-Yo of mass  $m$  has an axle of radius  $b$  and a spool of radius  $R$ . Its moment of inertia can be taken to be  $I = (1/2)mR^2$  and the thickness of the string can be neglected. The Yo-Yo is released from rest.

- a) What is the tension in the cord as the Yo-Yo descends?
- b) Use conservation of energy to find the angular velocity of the Yo-Yo when it reaches the bottom of the string.
- c) What happens to the Yo-Yo at the bottom of the string?

torque and force  
diagram; with  
this choice of sense  
of rotation (clockwise)  
and positive  $\hat{k}$  direction

Then  $a = b\alpha$  (1)

Newton's 2nd Law:  $mg - T = ma$  (2)

Torque Equation:  $bT = I_{cm}\alpha$  (3)

moment of inertia:  $I_{cm} = \frac{1}{2}mR^2$  (4)

Use  $mg - T = ma$  to solve for  $T$ .

$$\Rightarrow mg - T = m b \alpha \quad \text{eq (1)}$$

$$\Rightarrow mg - T = \frac{m b b T}{I_{cm}} \quad \text{eq (3)}$$

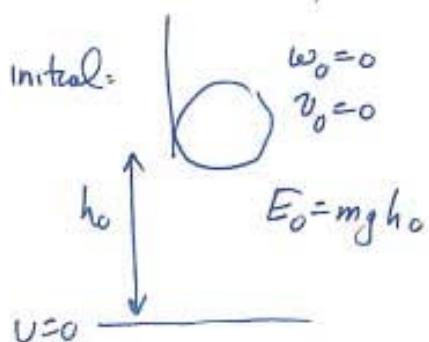

$$mg = T \left( 1 + \frac{mb^2}{I_{cm}} \right)$$

$$\Rightarrow T = \frac{mg}{1 + \frac{mb^2}{I_{cm}}} = \frac{mg}{1 + \frac{mb^2}{\frac{1}{2}mR^2}}$$

note:  $\alpha = \frac{b\tau}{I_{cm}} = \frac{b\tau}{\frac{1}{2}mR^2} = \frac{b}{\frac{1}{2}mR^2} \frac{mg}{1 + \frac{mb^2}{\frac{1}{2}mR^2}}$

$$a = b\alpha = \frac{b^2 \tau}{\frac{1}{2}mR^2}$$

## Conservation of Energy

$$E_f = \frac{1}{2}mv_f^2 + \frac{1}{2}I_{cm}w_f^2$$

$$v_f = b w_f, I_{cm} = \frac{1}{2}mR^2$$

$$\textcircled{2} \quad \begin{aligned} w_f & E_f = \frac{1}{2}mv_f^2 + \left(\frac{1}{2}mR^2\right)w_f^2 \\ v_f & = \frac{1}{2}mb^2w_f^2 + \frac{1}{2}\left(\frac{1}{2}mR^2\right)w_f^2 \end{aligned}$$

$$E_0 = mgh_0 = E_f = \left(\frac{1}{2}mb^2 + \frac{1}{2}\left(\frac{1}{2}mR^2\right)\right)w_f^2$$

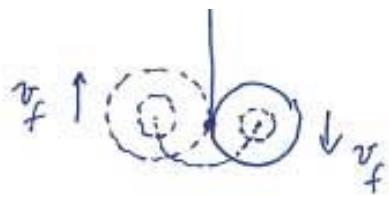

$$\Rightarrow w_f = \left( \frac{mgh_0}{\left(\frac{1}{2}mb^2 + \frac{1}{2}\left(\frac{1}{2}mR^2\right)\right)} \right)^{\frac{1}{2}}$$

note:  $h_0 = \frac{1}{2}at^2 \Rightarrow t = \left(\frac{2h_0}{a}\right)^{\frac{1}{2}}$

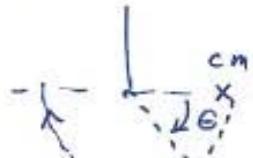

$$\begin{aligned} w_f &= \alpha t = \alpha \left(\frac{2h_0}{a}\right)^{\frac{1}{2}} \\ &= \left(\frac{2h_0}{\frac{1}{2}mR^2}\right)^{\frac{1}{2}} \end{aligned}$$

$$w_f = \left(\frac{2h_0}{\frac{1}{2}mR^2}, \frac{mg}{1 + \frac{mb^2}{\frac{1}{2}mR^2}}\right)^{\frac{1}{2}}$$

- c) At the bottom of the descent, the Yo-Yo is spinning with angular velocity  $w_f$ . The Yo-Yo pivots about the end of the string.

with angular velocity  $\omega_f = \frac{d\theta}{dt} = \frac{\pi \text{ rad}}{\Delta t}$

where  $\Delta t$  is the time it takes the yo-yo to go  $\pi$  radians. The momentum has reversed so,

$$\vec{I} = \Delta \vec{P}$$

The impulse  $\vec{I} = \int_T^T + mg) \hat{j} dt = -m v_f \hat{j} - m v_f \hat{j}$

$$\Rightarrow \Delta t(mg - T) = -2m v_f$$

$$\text{or } T = mg + 2m v_f = mg + 2m v_f \frac{\omega_f}{\pi}$$

Since  $v_f = b \omega_f =$  we have

$$T = mg + 2m b \frac{\omega_f^2}{\pi}$$
